

Can I transfer test results from test benches to a company server?

Microplan [Parseq](#) software includes the capability to automatically transfer test results from the local test bench PC to a SQL or MySQL database on the company server. After the data are transferred, all data management can be accomplished from the company. Data from all test benches can be stored and managed from a single location.

This is how the process works:

- 1) Records are saved to the test bench PC in a Microsoft Access database
- 2) Records are then transferred to the server – Note that the tables on the target database are to be configured to Microplan’s standard format as defined on each bench
- 3) When the data transfer has been confirmed, the records are deleted from the test bench PC
- 4) If, for any reason (LAN fault, etc.), data transfer is not possible, the records will remain on the test bench PC until the next transfer attempt

For sequences different from above, that require additional planning resources, a quotation for implementing the changes will be required. In this case, Microplan requests a clear specification of the format and data to be managed with examples with real world data.
