

Can we change the name of the PC of the test bench?

PC name attributed by Microplan is equal to the number of Microplan job order, for instance B803. In case of multiple test benches, belonging to the same project, PC name is B803-1, B803-2 and so on.

As far as Microplan's software are concerned the name of the computer is not significant, so it can be renamed by the customer, unless it is somehow a server for some other test benches like for example a station working as an electrical safety tests server, or a dry test bench server for a wet test bench, but also in case the connection is made by PC name and not by IP address.

The PC name equal to Microplan job order is also used when we set up a remote connection with Teamviewer, because in that case we are sure to what PC we are connected to. However the Teamviewer name is automatically inherited from the PC name during our initial installation, after that any change on the PC name will not affect it.
